Enabled

Disabled

Under Interfaces, you can scan for other devices in the area that may be causing interference with frequency usage. You can also Enable and Disable the wireless radio in the router. See example above. To Enable or Disable, click on the D or E Buttons. You can also click on the name wlan1 and choose to Enable or Disable once you are there. You can also make changes to the SSID and Frequency there.

Radio Settings

From the Wireless Menu option you can choose Security Profiles. Once there, you can change the pre-set password required to logon to your wireless network, if desired. The Default password is set to "password".

To change the password, click anywhere in the white field under the heading WPA Pre-Shared Key. After changing the password, click Apply to save.
